

INTRO TO ETHICS AND FAIRNESS

Eunsuk Kang

Required reading: R. Caplan, J. Donovan, L. Hanson, J. Matthews. "Algorithmic Accountability: A Primer", Data & Society (2018).

LEARNING GOALS

- Review the importance of ethical considerations in designing AI-enabled systems
- Recall basic strategies to reason about ethical challenges
- Diagnose potential ethical issues in a given system
- Understand the types of harm that can be caused by ML
- Understand the sources of bias in ML

OVERVIEW

Many interrelated issues:

- Ethics
- Fairness
- Justice
- Discrimination
- Safety
- Privacy
- Security
- Transparency
- Accountability

Each is a deep and nuanced research topic. We focus on survey of some key issues.

A close-up portrait of Martin Shkreli, a man with dark hair and a beard, wearing a suit and tie, looking slightly to the side with a neutral expression.

In September 2015, Shkreli received widespread criticism when Turing obtained the manufacturing license for the antiparasitic drug Daraprim and raised its price by a factor of 56 (from USD 13.5 to 750 per pill), leading him to be referred to by the media as "the most hated man in America" and "Pharma Bro".

-- [Wikipedia](#)

"I could have raised it higher and made more profits for our shareholders. Which is my primary duty." -- Martin Shkreli

Speaker notes

TERMINOLOGY

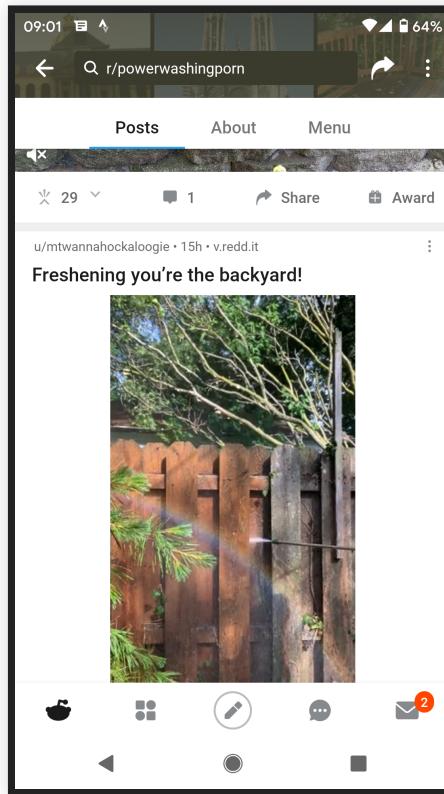

- Legal = in accordance to societal laws
 - systematic body of rules governing society; set through government
 - punishment for violation
- Ethical = following moral principles of tradition, group, or individual
 - branch of philosophy, science of a standard human conduct
 - professional ethics = rules codified by professional organization
 - no legal binding, no enforcement beyond "shame"
 - high ethical standards may yield long term benefits through image and staff loyalty

ANOTHER EXAMPLE: SOCIAL MEDIA

Q. What is the (real) organizational objective of the company?

OPTIMIZING FOR ORGANIZATIONAL OBJECTIVE

- How do we maximize the user engagement?
 - Infinite scroll: Encourage non-stop, continual use
 - Personal recommendations: Suggest news feed to increase engagement
 - Push notifications: Notify disengaged users to return to the app

ADDICTION

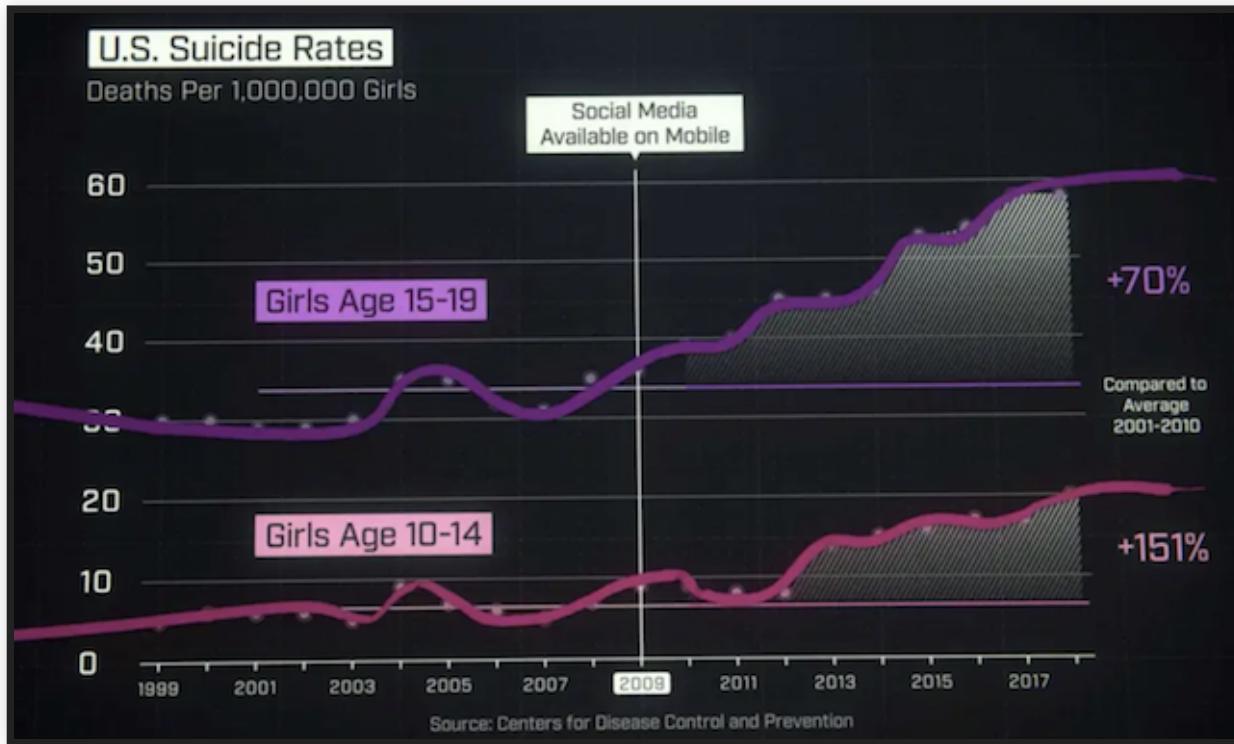

- 210M people worldwide addicted to social media
- 71% of Americans sleep next to a mobile device
- ~1000 people injured **per day** due to distracted driving (USA)

<https://www.flurry.com/blog/mobile-addicts-multiply-across-the-globe/>

https://www.cdc.gov/motorvehiclesafety/Distracted_Driving/index.html

MENTAL HEALTH

- 35% of US teenagers with low social-emotional well-being have been bullied on social media.
- 70% of teens feel excluded when using social media.

<https://lefronic.com/social-media-addiction-statistics>

DISINFORMATION & POLARIZATION

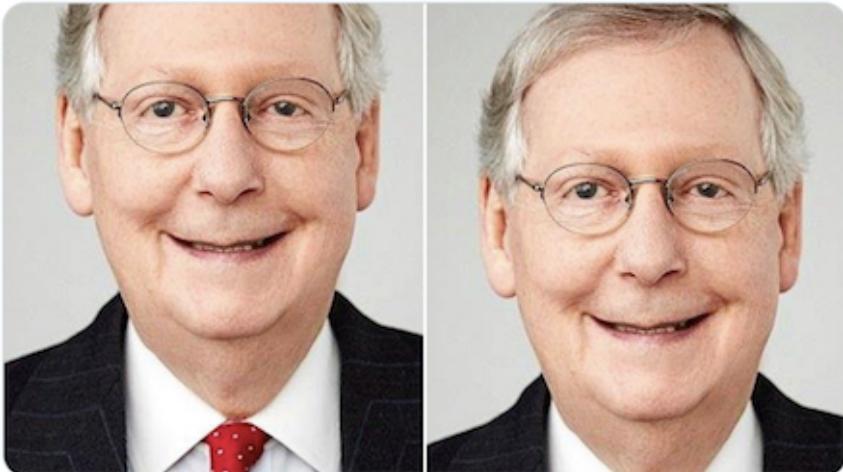

DISCRIMINATION

 Tony "Abolish (Pol)ICE" Arcieri 🇺🇸
@bascule

Trying a horrible experiment...

Which will the Twitter algorithm pick: Mitch McConnell or Barack Obama?

GOOGLE QUIETLY REMOVES 'DON'T BE EVIL' PREFACE FROM CODE OF CONDUCT

Google employees resigned this month over the company's autonomous weapons project

Anthony Cuthbertson | @ADCuthbertson | Monday 21 May 2018 12:21

- Q. Are these companies intentionally trying to cause harm? If not, what are the root causes of the problem?

CHALLENGES

- Misalignment between organizational goals & societal values
 - Financial incentives often dominate other goals ("grow or die")
- Insufficient amount of regulations
 - Little legal consequences for causing negative impact (with some exceptions)
 - Poor understanding of socio-technical systems by policy makers
- Engineering challenges, both at system- & ML-level
 - Difficult to clearly define or measure ethical values
 - Difficult to predict possible usage contexts
 - Difficult to predict impact of feedback loops
 - Difficult to prevent malicious actors from abusing the system
 - Difficult to interpret output of ML and make ethical decisions
 - ...

These problems have existed before, but they are being rapidly exacerbated by the widespread use of ML

FAIRNESS

LEGALLY PROTECTED CLASSES (US)

- Race (Civil Rights Act of 1964)
- Color (Civil Rights Act of 1964)
- Sex (Equal Pay Act of 1963; Civil Rights Act of 1964)
- Religion (Civil Rights Act of 1964)
- National origin (Civil Rights Act of 1964)
- Citizenship (Immigration Reform and Control Act)
- Age (Age Discrimination in Employment Act of 1967)
- Pregnancy (Pregnancy Discrimination Act)
- Familial status (Civil Rights Act of 1968)
- Disability status (Rehabilitation Act of 1973; Americans with Disabilities Act of 1990)
- Veteran status (Vietnam Era Veterans' Readjustment Assistance Act of 1974; Uniformed Services Employment and Reemployment Rights Act)
- Genetic information (Genetic Information Nondiscrimination Act)

Barocas, Solon and Moritz Hardt. "[Fairness in machine learning](#)." NIPS Tutorial 1 (2017).

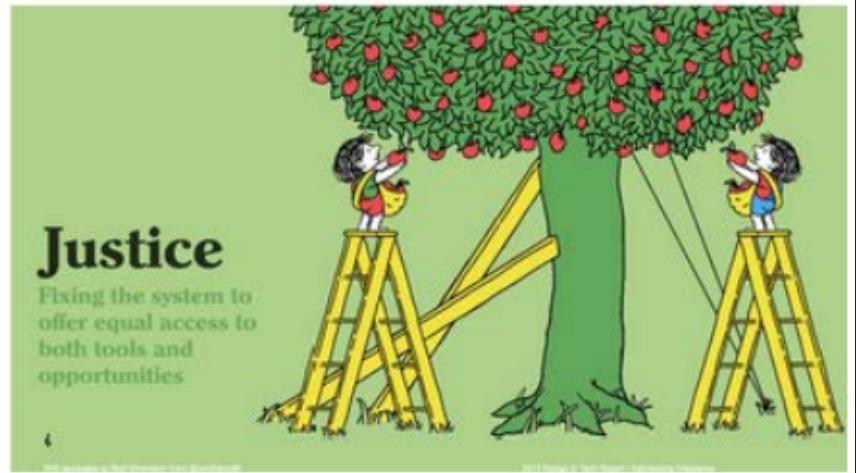

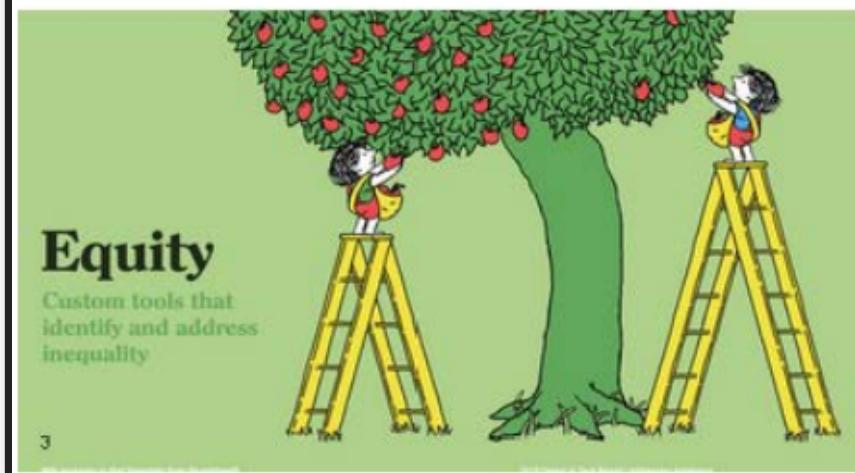

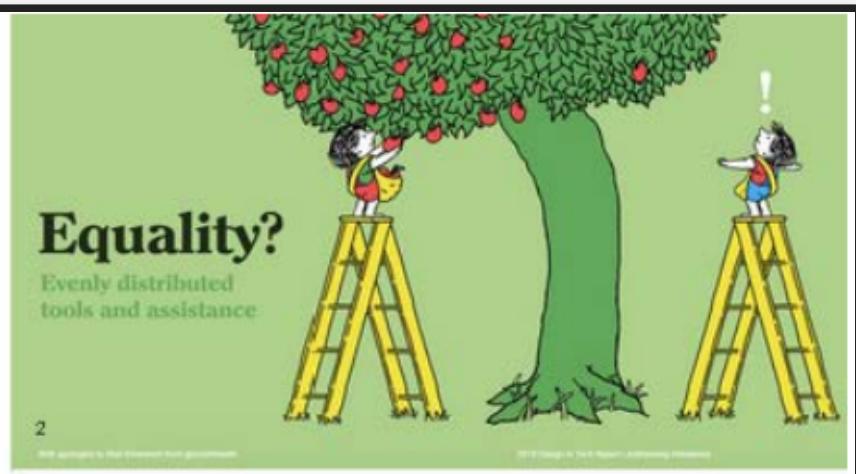

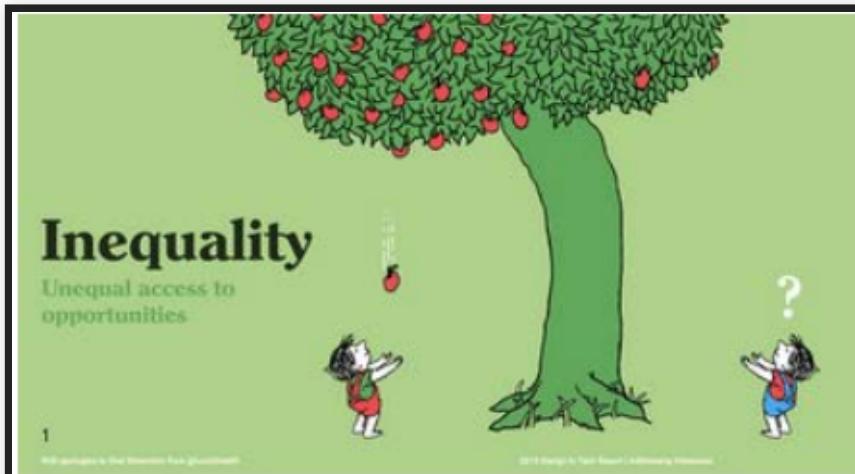

REGULATED DOMAINS (US)

- Credit (Equal Credit Opportunity Act)
- Education (Civil Rights Act of 1964; Education Amendments of 1972)
- Employment (Civil Rights Act of 1964)
- Housing (Fair Housing Act)
- ‘Public Accommodation’ (Civil Rights Act of 1964)

Extends to marketing and advertising; not limited to final decision

Barocas, Solon and Moritz Hardt. "[Fairness in machine learning](#)." NIPS Tutorial 1 (2017).

EQUALITY VS EQUITY VS JUSTICE

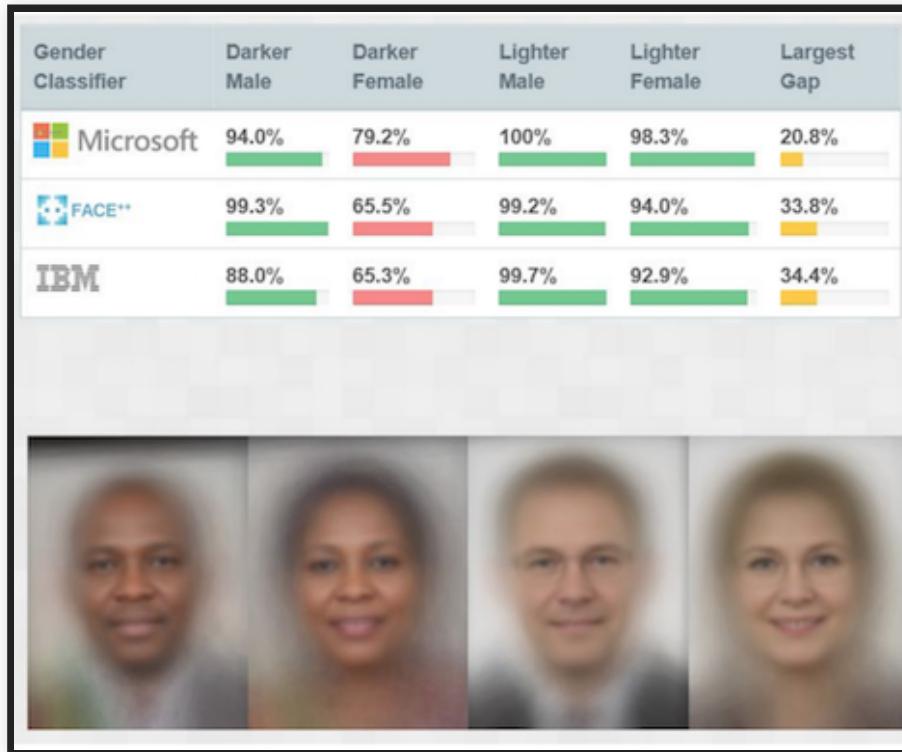

TYPES OF HARM ON SOCIETY

- **Harms of allocation:** Withhold opportunities or resources
- **Harms of representation:** Reinforce stereotypes, subordination along the lines of identity

“The Trouble With Bias”, Kate Crawford, Keynote@N(eur)IPS (2017).

HARMS OF ALLOCATION

- Withhold opportunities or resources
- Poor quality of service, degraded user experience for certain groups

Q. Other examples?

Gender Shades: Intersectional Accuracy Disparities in Commercial Gender Classification, Buolamwini & Gebru, ACM FAT* (2018).

HARMS OF REPRESENTATION

- Over/under-representation, reinforcement of stereotypes

Q. Other examples?

Discrimination in Online Ad Delivery, Latanya Sweeney, SSRN (2013).

IDENTIFYING HARMS

	Allocation of resources	Quality of Service	Stereotyping	Denigration	Over- / Under-Representation
Hiring system does not rank women as highly as men for technical jobs	x	x	x		x
Photo management program labels image of black people as “gorillas”		x		x	
Image searches for “CEO” yield only photos of white men on first page			x		x

- Multiple types of harms can be caused by a product!
- Think about your system objectives & identify potential harms.

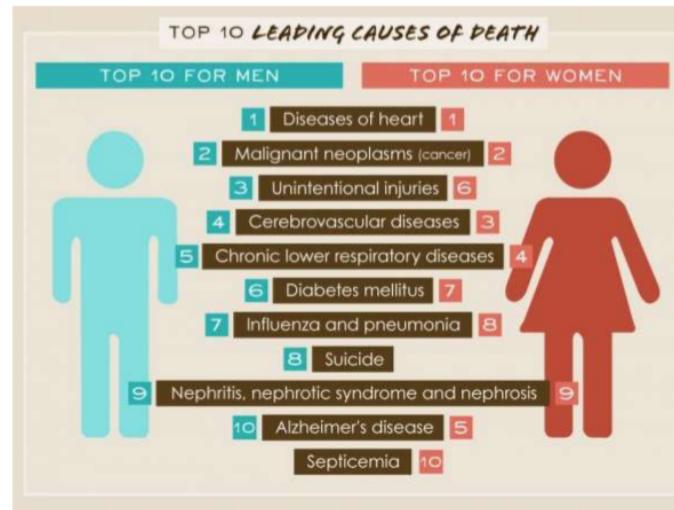

Challenges of incorporating algorithmic fairness into practice, FAT Tutorial (2019).*

NOT ALL DISCRIMINATION IS HARMFUL

FEDERAL TRADE COMMISSION

Mortgage discrimination is against the law.

- Loan lending: Gender discrimination is illegal.
- Medical diagnosis: Gender-specific diagnosis may be desirable.
- The problem is *unjustified* differentiation; i.e., discriminating on factors that should not matter
- Discrimination is a **domain-specific** concept, and must be understood in the context of the problem domain (i.e., world vs machine)

Q. Other examples?

ROLE OF REQUIREMENTS ENGINEERING

- Identify system goals
- Identify legal constraints
- Identify stakeholders and fairness concerns
- Analyze risks with regard to discrimination and fairness
- Analyze possible feedback loops (world vs machine)
- Negotiate tradeoffs with stakeholders
- Set requirements/constraints for data and model
- Plan mitigations in the system (beyond the model)
- Design incident response plan
- Set expectations for offline and online assurance and monitoring

SOURCES OF BIAS

WHERE DOES THE BIAS COME FROM?

The image displays two side-by-side screenshots of the Google Translate interface, highlighting how language models can exhibit gender bias.

Top Screenshot (English to Turkish):

- Input: "He is a nurse
She is a doctor"
- Output: "O bir hemşire
O bir doktor"
- Notes: The output preserves the gender of the input, suggesting a bias towards male subjects.

Bottom Screenshot (Turkish to English):

- Input: "O bir hemşire
O bir doktor"
- Output: "She is a nurse
He is a doctor" (with a checkmark indicating it's a suggested edit)
- Notes: The output changes the gender of the subjects, reflecting a different bias or rule applied by the model.

Semantics derived automatically from language corpora contain human-like biases, Caliskan et al., Science (2017).

WHERE DOES THE BIAS COME FROM?

The image shows a screenshot of the Microsoft Translator web interface. At the top, there's a navigation bar with the Microsoft logo, a search bar containing 'Search the web' with a magnifying glass icon, and a 'Sign in' link. Below the navigation bar, the word 'Translator' is visible along with links for 'Text', 'Conversation', 'Apps', 'For business', and 'Help'. The main area consists of two side-by-side translation windows.

Top Left Translation Window: The source language is English and the target language is Turkish. The input text is "He is a nurse.
She is a doctor." The output text is "O bir hemşire.
O bir doktor." A progress bar at the bottom indicates 31/5000 characters processed. There are 'Suggest an edit' and sharing icons at the bottom right.

Top Right Translation Window: The source language is Turkish and the target language is English. The input text is "O bir hemşire.
O bir doktor." The output text is "She's a nurse.
He's a doctor." A progress bar at the bottom indicates 28/5000 characters processed. There are 'Suggest an edit' and sharing icons at the bottom right.

Bottom Left Translation Window: The source language is Turkish and the target language is English. The input text is "O bir hemşire.
O bir doktor." A progress bar at the bottom indicates 28/5000 characters processed. There are 'Suggest an edit' and sharing icons at the bottom right.

Bottom Right Translation Window: The source language is English and the target language is Turkish. The input text is "She's a nurse.
He's a doctor." The output text is "O bir hemşire.
O bir doktor." A progress bar at the bottom indicates 28/5000 characters processed. There are 'Suggest an edit' and sharing icons at the bottom right.

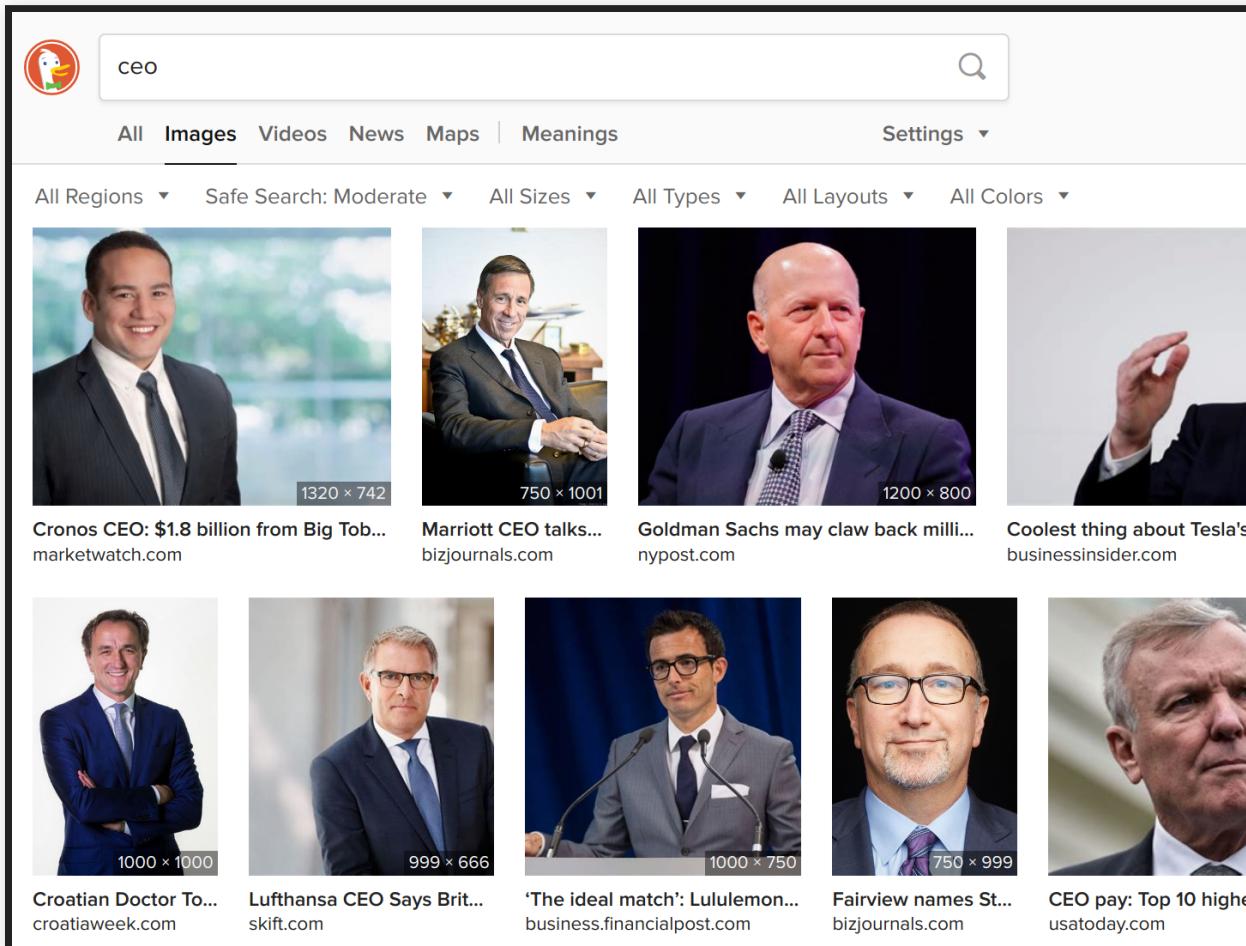

SOURCES OF BIAS

- Historial bias
- Tainted examples
- Skewed sample
- Limited features
- Sample size disparity
- Proxies

Big Data's Disparate Impact, Barocas & Selbst California Law Review (2016).

HISTORICAL BIAS

Data reflects past biases, not intended outcomes

Speaker notes

"An example of this type of bias can be found in a 2018 image search result where searching for women CEOs ultimately resulted in fewer female CEO images due to the fact that only 5% of Fortune 500 CEOs were woman—which would cause the search results to be biased towards male CEOs. These search results were of course reflecting the reality, but whether or not the search algorithms should reflect this reality is an issue worth considering."

TAINTED EXAMPLES

Bias in the dataset caused by humans

TECH \ AMAZON \ ARTIFICIAL INTELLIGENCE

Amazon reportedly scraps internal AI recruiting tool that was biased against women

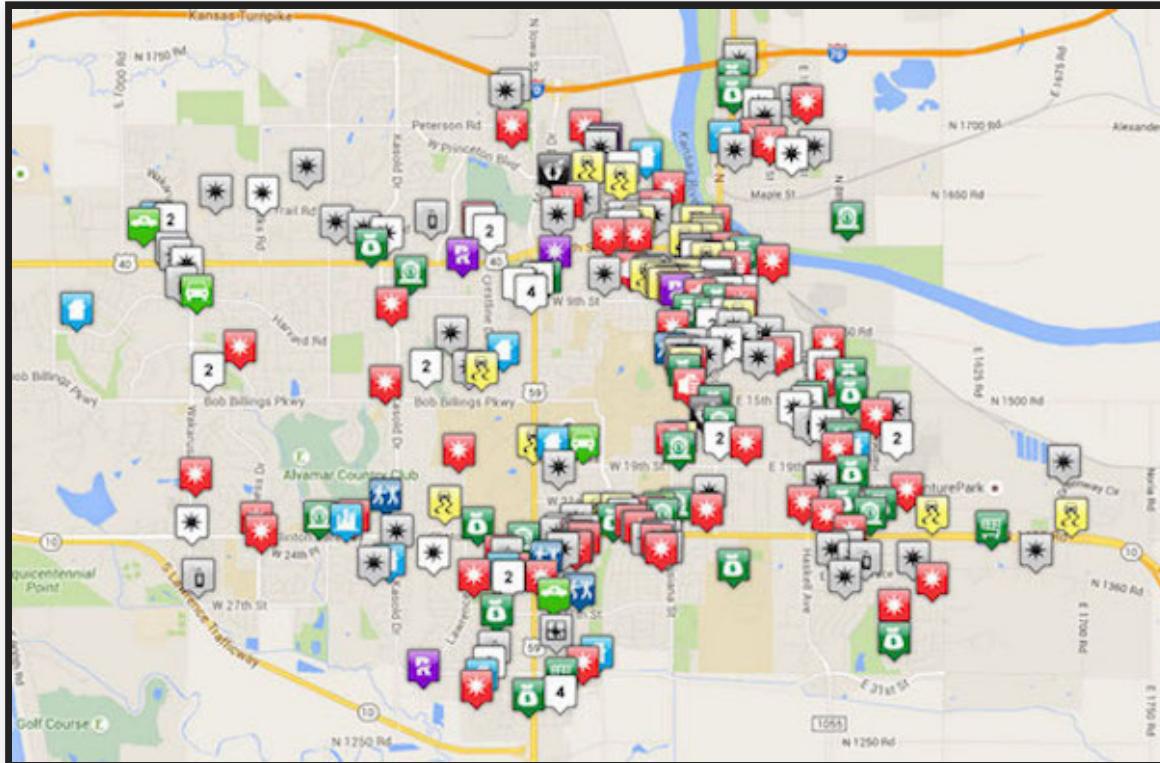

The secret program penalized applications that contained the word “women’s”

By James Vincent | Oct 10, 2018, 7:09am EDT

- Example: Hiring decision dataset
 - Some labels created manually by employers
 - Dataset "tainted" by biased human judgement

SKEWED SAMPLE

Initial bias compounds over time & skews sampling towards certain parts of population

- Example: Crime prediction for policing strategy

LIMITED FEATURES

Features that are less informative or reliable for certain parts of the population

- Features that support accurate prediction for the majority may not do so for a minority group
- Example: Employee performance review
 - "Leave of absence" as a feature (an indicator of poor performance)
 - Unfair bias against employees on parental leave

SAMPLE SIZE DISPARITY

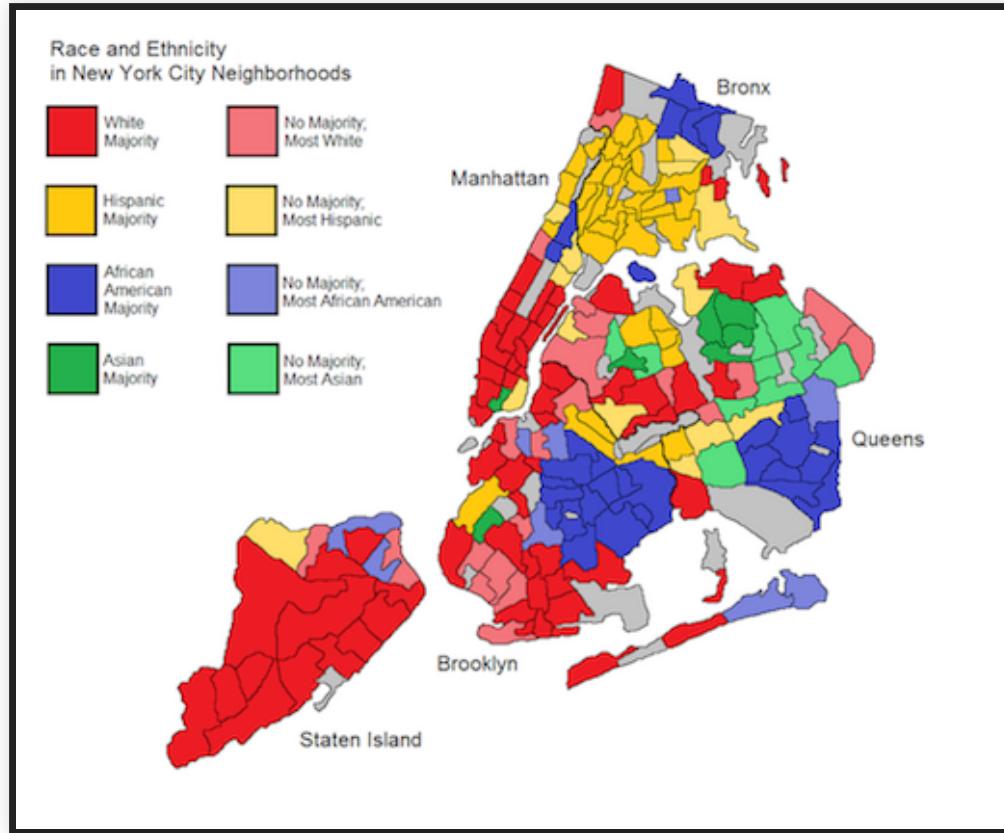

Less data available for certain parts of the population

- Example: "Shirley Card"
 - Used by Kodak for color calibration in photo films
 - Most "Shirley Cards" used Caucasian models
 - Poor color quality for other skin tones

PROXIES

Certain features are correlated with class membership

- Example: Neighborhood as a proxy for race
- Even when sensitive attributes (e.g., race) are erased, bias may still occur

CASE STUDY: COLLEGE ADMISSION

- Objective: Evaluate applications & identify students who are most likely to succeed
- Features: GPA, GRE/SAT, gender, race, undergrad institute, alumni connections, household income, hometown, etc.,

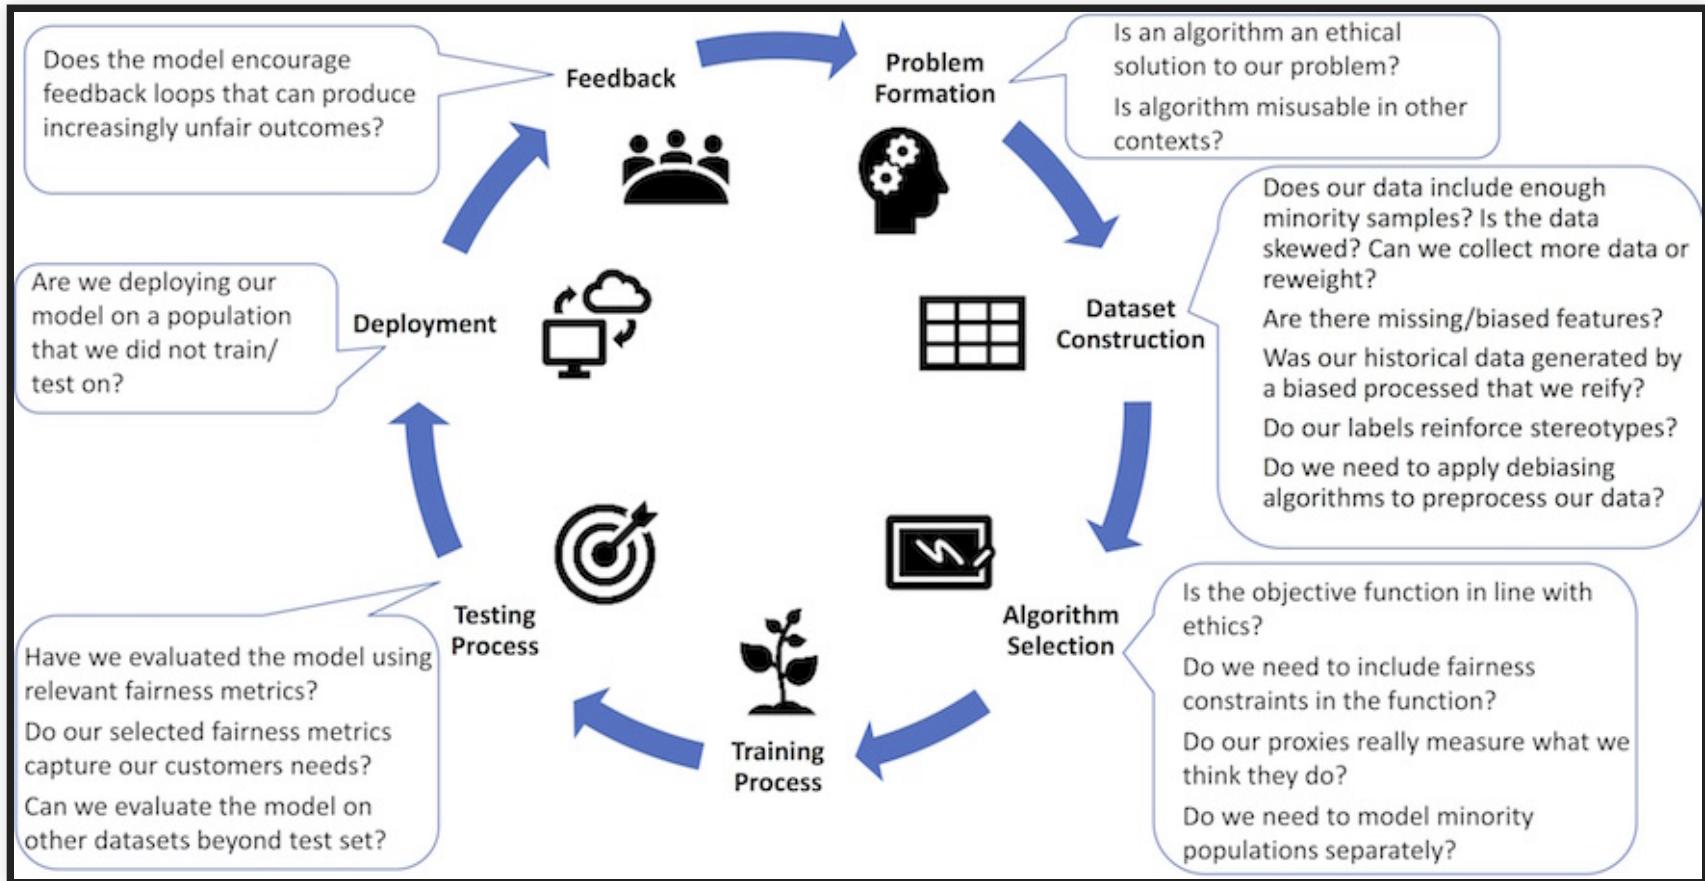

CASE STUDY: COLLEGE ADMISSION

- Possible harms: Allocation of resources? Quality of service? Stereotyping? Denigration? Over-/Under-representation?
- Sources of bias: Skewed sample? Tainted examples? Historical bias? Limited features? Sample size disparity? Proxies?

BUILDING FAIR ML SYSTEMS

FAIRNESS MUST BE CONSIDERED THROUGHOUT THE ML LIFECYCLE!

Fairness-aware Machine Learning, Bennett et al., WSDM Tutorial (2019).

SUMMARY

- Many interrelated issues: ethics, fairness, justice, safety, security, ...
- Both legal & ethical dimensions
- Challenges with developing ethical systems
- Large potential for damage: Harm of allocation & harm of representation
- Sources of bias in ML
 - Skewed sample, tainted examples, limited features, sample size, disparity, proxies
- Addressing fairness throughout the ML pipeline
- Data bias & data collection for fairness
- **Next class:** Definitions of fairness, measurement, testing for fairness
